

Per- & Poly- Fluoroalkyl Substances

PFAS

Because of their widespread use and their persistence in the environment, many PFAS are found in the blood of people and animals all over the world and are present at low levels in a variety of food products and in the environment.

There are thousands of PFAS chemicals, and they are found in many different consumer, commercial, and industrial products. This makes it challenging to study and assess the potential human health and environmental risks.

PFAS are widely used, long lasting chemicals, components of which break down very slowly over time.

Scientific studies have shown that exposure to some PFAS in the environment may be linked to harmful health effects in humans and animals.

PFAS are found in water, air, fish, and soil at locations across the nation and the globe.
